CATEGORY: ACCESSIBILITY, SOCIAL GOOD & SUSTAINABILITY / INDIA PROTOTYPE

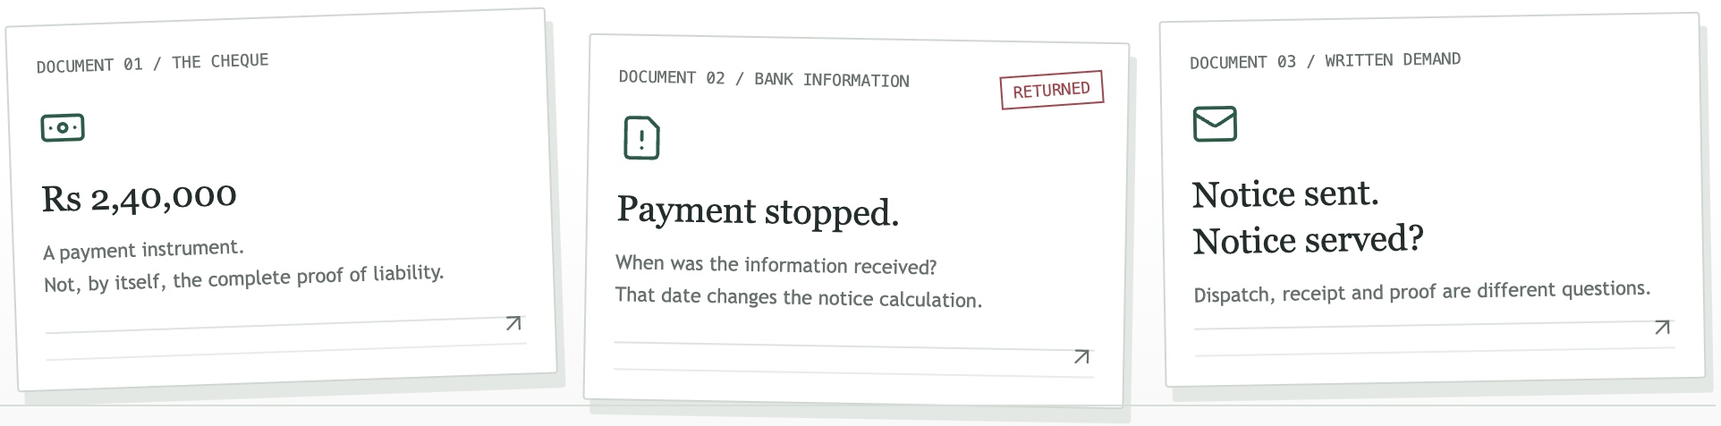

LegisiMate

Legal preparation.
Locally grounded.

INDIA PROTOTYPE / ILLUSTRATIVE CASE LM-026

Meera runs a small textile business.
She reports Rs 2,40,000 unpaid. A cheque is stopped. The customer disputes the goods.

One narrow case type demonstrates a broader preparation workflow. No other jurisdiction is enabled today.

A reusable way to prepare with evidence, before making legal decisions. Demonstrated today through Indian cheque-dishonour checks, sourced rehearsals and a practical advocate brief.

Open the case →

Working scope: Indian Section 138 preparation / Not legal advice or an outcome prediction

Global ambition. Country-specific evidence.

01 / WHY THIS EXISTS

A cheque is not a complete case.

The difficult part often comes before an argument: knowing what is missing, what the dates mean, and what to ask next.

Business owner | Junior advocate | Law student

"I have the cheque. What else do I need to bring?"

BEFORE / INFORMATION WITHOUT STRUCTURE

A folder full of uncertainties.

- A memo date mistaken for the date it was received.
- Invoices and disputed delivery records mixed together.
- A general AI answer with no inspectable source.

→

AFTER / A BETTER PROFESSIONAL CONVERSATION

A file with the right questions.

- Known dates separated from unknown dates.
- The strongest opposing arguments rehearsed.
- A brief linking preparation steps to source evidence.

Reduce the preparation barrier.

Plain-language steps before complex legal choices.

Make the basis inspectable.

Source text, tool results and missing evidence stay visible.

Keep people in the decision.

Professional review and voluntary resolution, not automated legal action.

02 / THE WHOLE APPLICATION IN ONE JOURNEY

From scattered papers to a preparation brief.

The same facts travel through every stage. A missing fact does not become true just because the AI needs an answer.

1 Case facts — 2 Calendar — 3 Research — 4 Rehearsal — 5 The brief

AN AGENTIC TOOL-SELECTION LOOP PLUS LOCAL RAG.

Choose the next research action.

The model selects bounded tools. SQLite retrieval returns statutory passages and precedent extracts, including material relevant to the opposing position.

In
The case, calendar checks and prior tool results.

Out
Inspectable research steps and source records.

Follow the case

Dates are calculated by code. Research actions and arguments are generated by the model. Source quotations are resolved by the server.

03 / WHAT SHOULD NEVER BE GUESSED

A date changes the next step.

A small example of why a deterministic tool belongs beside a generative model.

Bank information received **1 September 2026**

Date the written demand was given

28/09/2026

Receipt day — 30-day base boundary — Beyond

- [x] The bank-information receipt date is confirmed.

1	2	3	4	5	6	7	8	9	10
11	12	13	14	15	16	17	18	19	20
21	22	23	24	25	26	**27**	28	29	30

Rule reference: Section 138 proviso (b), NI Act.
Example calculation excludes the receipt day.

Base notice check met

Within the base 30-day window.

This date is 27 days after the supplied receipt date. That meets this one calendar check. The notice, dispatch, effective service and remaining ingredients still need evidence.

> Base boundary: 1 October 2026, only when the bank-information receipt date is confirmed. This isolated example is not legal advice.

What the code can do | **What it cannot establish** | **Another important difference**

04 / GENERATIVE AI + AGENTIC WORKFLOW + RAG

A research desk, not a black box.

The agent chooses a bounded research action. Local retrieval returns source records. A passage ID binds a quotation to its text.

Notice & service

Replay research

1 `check_deadlines`
Read the supplied receipt and notice dates; preserve the unconfirmed service question.

2 `search_statutes`
Retrieve Section 138 notice and payment conditions and Section 142 filing provisions.

3 `search_precedents`
Look for authority concerning statutory notice and disputed service, including adverse material.

4 `read_authority`
Open a returned source record. Pass its text-bound passage choices to the rehearsal.

▶ Implementation, without the mystery

THE QUOTATION TEST

A source is not a decorative footnote.

Corpus passage | Invented claim

NI ACT / SECTION 138 / EXPLANATION

"legally enforceable debt or other liability"

Source: IND_central_2189_s138_p1

This phrase exists in the cited corpus extract. A text match is not proof that an argument is legally correct or a precedent is still good law.

05 / A REHEARSAL, NOT A VERDICT GENERATOR

One case. Three rehearsals. No preset winner.

The product generates case-specific paths. The examples here illustrate three different preparation questions.

Same case facts. Fresh conversation for every path.

Your position: **Recipient** | Issuer

PATH 1

Notice & service

Which dates can be proved?

PATH 2

Debt & dispute

What does the cheque represent?

PATH 3

Records & resolution

What would make the next step useful?

Notice & service

Play the exchange

Defence counsel

The memo date alone does not establish when the bank information reached the recipient. Where are the dispatch and effective-service records?

Complainant counsel

Prepare the actual receipt record, demand notice and dispatch or tracking evidence. A date in the narrative should not fill a documentary gap.

Magistrate role

Base periods can be calculated from supplied dates. Effective service and filing still need records; this rehearsal does not decide maintainability.

Illustrative dialogue. No witness, service date or document is invented to repair a gap.

06 / WHAT THE USER TAKES AWAY

A better file.
A better conversation with an advocate.

The output is preparation: what to raise, what to collect, what remains unresolved and which path deserves attention.

LegisiMate

ILLUSTRATIVE PREPARATION BRIEF
CASE LM-026

Resolve notice and service evidence first.

Path 1 / Notice & service / Cheque recipient perspective. A preparation priority, not a winning-path claim.

What to raise | What to collect | What stays unknown

The issue to raise

Raise the difference between the memo date, receipt of bank information, giving the demand and effective service. Ask an advocate how the actual records affect the timing analysis.

This brief is based on an illustrative case. The live application generates its brief from the facts and retrieved evidence in that analysis.

A REAL-WORLD NEXT-STEP LIST

Leave with actions, not a percentage.

- [ ] Collect the bank information receipt and return memo.
- [ ] Find dispatch, tracking and notice-service records.
- [ ] Review timing, liability and voluntary options with an advocate.

0 / 3 preparation tasks marked

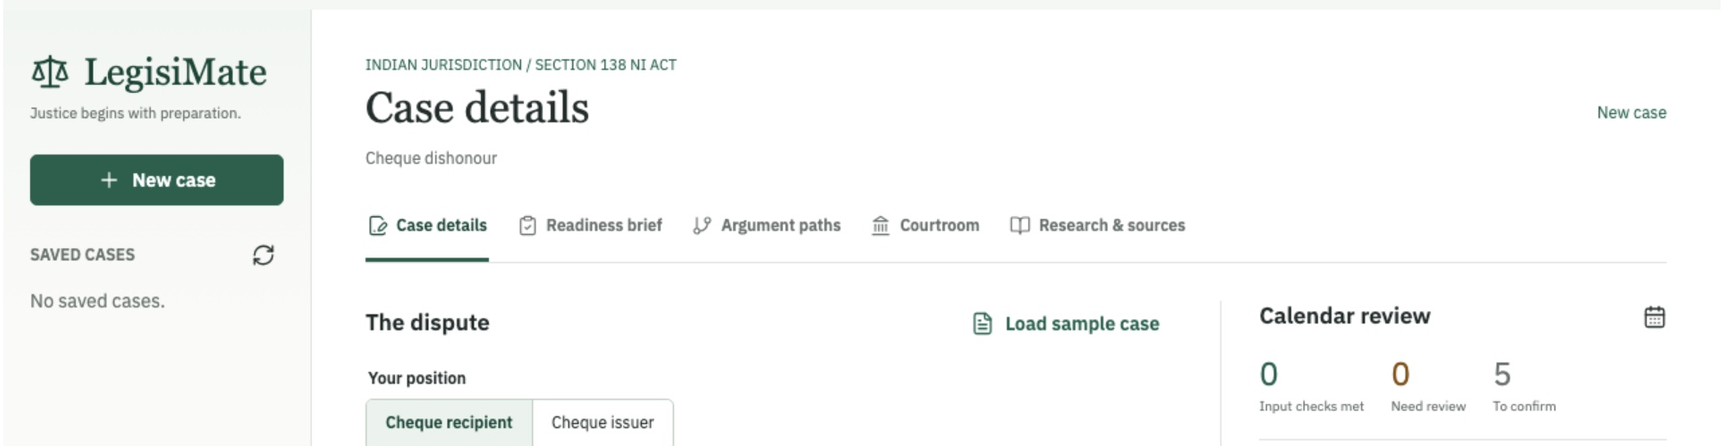

> Marking a task here only updates this illustrative checklist. It does not authenticate records, clear the case or change its prospects.

07 / HOW TO USE THE PRODUCT

The workbench.
Not just the pitch.

One case, five views: details, readiness brief, argument paths, courtroom rehearsal, and research with sources.

Actual local application / New case view

Embedded screenshot of the implemented workbench. This presentation runs independently and does not send information to a model.

01 / ADD THE FACTS

Choose your side.

Use anonymised facts. Leave unconfirmed dates blank. Add optional text extracts.

02 / REVIEW & CONSENT

Check the calendar.

Give explicit consent before model analysis. Calendar preview itself is local.

03 / INSPECT THE RESULT

Read, compare, open sources.

Review the brief and paths. Follow citations to corpus text and inspect tool results.

04 / TAKE THE NEXT STEP

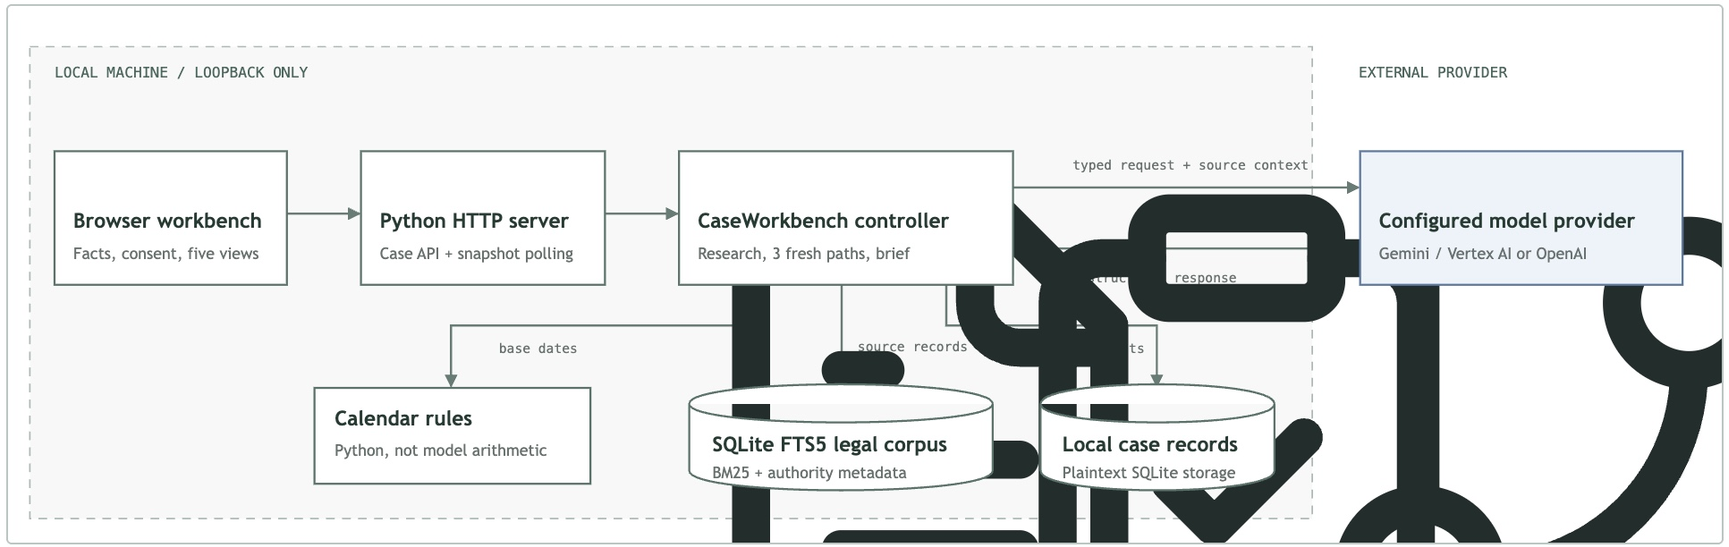

Export or delete locally.

Use the brief with an advocate. Local deletion cannot erase copies held by a

08 / IMPLEMENTED PROTOTYPE ARCHITECTURE

What is actually running.

A small, inspectable local system. The browser and legal corpus are local; consented case context crosses the boundary to the configured model.

Request / data flow Local trust boundary Selectable components

Trace a case request

Small by design.

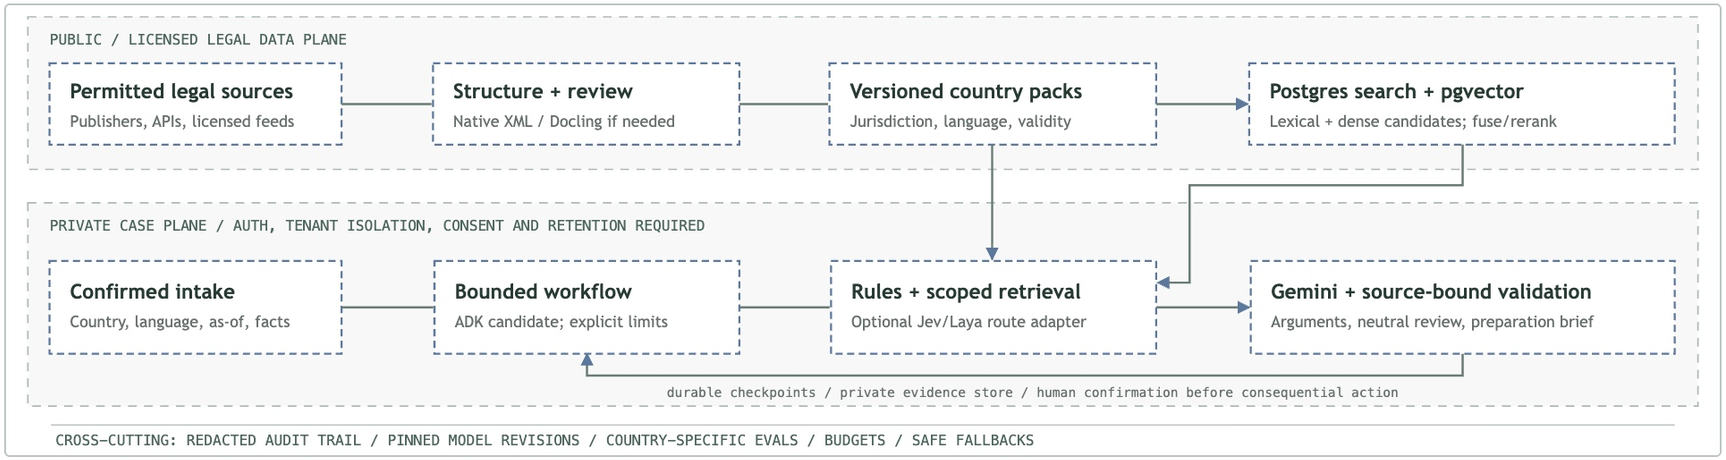

The prototype is scoped to Indian Section 138 preparation with native Gemini / Vertex AI and OpenAI-compatible adapters plus Cloud Run container packaging (Dockerfile, cloudbuild.yaml, pre-seeded showcase case).

09 / PROPOSED ARCHITECTURE / NOT IMPLEMENTED

Reuse the engine. Localise the law.

A phased target, not a stack of every fashionable tool. Legal-source rights, country scope and effective dates come before model selection.

TARGET: NATIVE GEMINI GENERATION + ONE WORKFLOW RUNTIME + VERSIONED JURISDICTION PACKS

Dashed components are proposed. A routing model never chooses governing law or authenticates evidence.

Trace the target flow

Start with the smallest validated change.

Add a provider adapter and a versioned country contract first. Hybrid retrieval, document parsing and decision routing enter only after targeted evaluation. No deployment, downloads or model integrations are performed by this deck.

10 / MODEL FEASIBILITY / RESEARCH DATED 17 OCTOBER 2026

Fast decisions are not legal reasoning.

Jev and Laya can answer bounded questions. Neither is a drop-in replacement for the open-ended arguments and brief the product currently generates.

Jev / hosted | Laya / open weights | Existing baseline

Jev / TypeSafe System One

A hosted decision model for typed questions over supplied state. It selects among declared options or returns bounded decision values; it does not write a legal argument or preparation brief.

Plausible role

Choose a research tool or a document/issue label from a short, allowlisted set.

Main benefit to test

Lower routing latency and fewer malformed structures, compared with the existing structured generator.

Data and deployment

Remote API; access, pricing, retention, region and service terms must be verified before private case data is sent. SDK licence does not license model weights.

Decisive limitation

Typed output is not proof that the chosen action is correct. Independent pilot results vary by task; probabilities need legal-workload calibration.

Primary launch article | Official SDK

PROPOSED ROUTING CONTRACT / POLICY ILLUSTRATION

Give a small decision the right job.

Routing situation

Short, supported language; five tool choices

Candidate for a controlled routing trial.

Supply a short, consented state and five explicit tool choices. Include an abstain path. Validate the action, arguments, token budget and supported language; permission and date checks remain outside the model.

No Jev/Laya model runs here. This is the proposed control policy, not a measured model result.

11 / INTERNATIONAL UTILITY / EXPANSION PROPOSAL

The workflow can travel. The law must stay local.

Regions organise our research; they are not unified legal systems. Only the India prototype is implemented. Each additional country needs a licensed, versioned, locally evaluated pack.

India	EU	Africa	ASEAN	East Asia	Americas
PROTOTYPE / ONE CASE TYPE	RESEARCH / MEMBER-STATE LAYERS	RESEARCH / COUNTRY BY COUNTRY	RESEARCH / NATIONAL SYSTEMS	RESEARCH / ORIGINAL LANGUAGES	RESEARCH / FEDERAL + LOCAL

India / the implemented prototype

Indian Section 138 cheque-dishonour preparation is the current working slice: supplied-date checks, a selected local corpus, independent role rehearsals and a brief. This is not coverage of every Indian dispute, current amendment or court.

> Next: review source rights and currency, formalise a versioned pack, and validate rule exceptions and source treatment with an Indian practitioner. Other countries are not enabled.

Prototype architecture

JURISDICTION PASSPORT / PROPOSED FORMAT

Scope	India / Section 138 preparation
Language	English prototype; no validated multilingual mode
Source route	Selected local statutory and precedent extracts
Version	Current corpus snapshot; no complete point-in-time service
Rights	Existing corpus reuse and completeness require review
Readiness	Working local prototype, not legal certification

1 / Confirm rights **2 / Preserve structure** **3 / Version the pack** **4 / Evaluate locally** **5 / Release narrowly**

The decisions behind the diagram.

Primary repositories, model cards and publisher documentation reviewed. This is a sourced design assessment, not completed integration, exhaustive ecosystem coverage or a new performance benchmark.

Design iterations | Jev / Laya audit | Repository shortlist | Build & release gates | Source register

Pass 1 / Can one worldwide corpus solve the problem?

No. Similar words do not establish governing law, legal authority or effective dates. The design moved to versioned country/use-case packs with explicit jurisdiction confirmation. Regional clusters are research and market groupings, not retrieval permission to blend foreign law.

Pass 2 / Can Jev or Laya replace the current model?

Only for a bounded subtask. The current research decision includes free-form material; paths, nine role statements and the brief require generation. A new router may add overhead if another model must still write its query. Keep deterministic code, the current structured generator and reviewed templates as baselines.

Pass 3 / Does adding graph RAG and many agents improve legal quality?

Not established. Prefer one workflow runtime and filtered lexical+dense retrieval. Add graph enrichment only if it improves expert-labelled citation-chain tasks after accounting for extraction cost, update/deletion correctness and false relationships. The chosen design is a hypothesis to test, not a benchmark result.

▶ Pass 4 / A feasible product boundary and differentiator

13 / CATEGORY: ACCESSIBILITY, SOCIAL GOOD & SUSTAINABILITY

Prepared people.
Accountable AI. Local legal grounding.

An international preparation vision for individuals, small businesses and legal-aid partners. Today's India-only prototype demonstrates a narrow, inspectable part of that vision.

IMPLEMENTED IN REPO

Useful now.

- Plain-language case intake and date checks.
- A bounded research agent and local RAG.
- Three independent argument rehearsals.
- Source-bound quotes and a preparation brief.
- Gemini / Vertex AI adapter + Cloud Run container.

FUTURE WORK / NOT YET DELIVERED

Earn the next step.

- Hybrid pgvector / embedding retrieval evaluation.
- Qualified legal evaluation and user studies.
- More languages and broader legal coverage.
- Secure multi-user access and retention controls.
- Measure preparation quality and task completion.

BOUNDARIES / NOT OUR CLAIM

Never a promised win.

- No calibrated outcome probability.
- No automatic filing or real judicial ruling.
- No authentication of user documents.
- No comprehensive good-law validation.
- No measured savings or pendency reduction yet.

The strongest outcome today is not "you will win." It is "you know what to prepare, what to question, and why."

▶ Why isn't this just another chatbot?

▶ Does a matched quotation mean the legal advice is right?

▶ What happens to case information?

▶ What is the Google Cloud & Gemini compatibility status?
